In reply to point 1 of the "Detailed Action"—*Newly Submitted claims 57, 58 and 67 directed to an invention independent form the invention originally claimed....*

The applicant submits that Fig 2b and 2c and their description, representing the physical embodiment of the system block diagram shown in Fig 1, are clearly non-distinct from the apparatus of claims 57, 58 and 67. Regarding claim 57, paragraph [00112] of the specification covering the elected species of Figure 2A states; *"In a position oriented lamp arrangement..., the light distribution can be nonsymmetrical and tailored to the needs of the room"*. This unique capability of the disclosed lighting fixture whose embodiment is described in detail in the following paragraphs produces the uniform illumination over non equidistant surface areas of claim 57. The description continues on to illustrate claim 58 *"increased task lighting"* by stating: *The various light source positions and angular placement on the surface of the illuminating device of Fig. 2A at an angle  $\beta$  horizontally and vertically angled  $\alpha$  to illuminate specific areas. The MSLS lamp will have concentrations of SLS at specific aimings to provide a wide "flood" type distribution to one part of the room and a "spot" type distribution to another such as to a painting on the wall. Each illumination target is at a different light intensity and color temperature or color rendering.*
